

Ukrainian section I.

Date: September 28, 1998

Country: Ukraine

Name of wetland: Upper Tisa between headwaters and Tyachiv

Geographical Coordinates: 23°30' W - 24°30' E - 47°04' S - 48°20' N

Altitude: 204-1650 m above Baltic sea level (a.s.l.)

Area: 90 000 ha

Overview: The headwaters of River Tisa, formed by the confluence of the rivers Chorna and Bila Tisa in the Transcarpathian Region (Ukrainian territory), with their picturesque landscapes, extremely wide biological diversity and original cultural features, are great natural and historical values of international importance and should be reckoned as part of the European natural heritage.

Wetland type: M, N, Ts, U, Va, W

Ramsar Criteria: 1a, c; 2a, b, d; 3b; 4a

Map of site included? see Map

Names and addresses of the compilers of this form:

Kricsfalusy V.V., Ruthenia Ecoclub, Uzhgorod, Ukraine

with M.Yu. Danilyuk, Yu.I. Krochko, V.I. Krokhtyak, A.Ye. Lugovoj , G.M. Mező-Kricsfalusy, A.V. Mihály, A.O. Polyanovsky, L.L. Potish, A.B. Vajnagi

General location: Ukraine, Transcarpathian Region, Tyachiv and Rahiv districts.

Physical features: The morphostructures of the region are extremely varied. In the section between Tyachiv and Dilove River Tisa and its tributaries, rivers Tereblya and Teresva, belong to the Verhovyna morphostructures. The low-mountain and middle-mountain erosional tectonic relief with peaks of 600-700 m a.s.l., which was formed on Oligocene sediments, prevails here.

The Polonyna morphostructure, the highest part of the Ukrainian Carpathians, has a high and middle-mountain relief. The morphostructure covers the Svydovets, Chornohora and Maramarosh morphostructures of lower orders. The Svydovets morphostructure is an extension of the Polonyna ridge. The Svydovets watershed line has retained marks of the Pleistocene glaciation. The inter-stream ridges have flat tops (plains). The Chornohora morphostructure embraces the highest mountain massif of the Ukrainian Carpathians. The mountain ridge crest with rounded tops belongs to the zone of the most stable cretaceous sandstones and

conglomerates. On the massif slopes there are well-preserved glacial relief forms and stone placers widely spread over them. The Maramarosh morphostructure embraces the Rahiv and Strimchak morphostructures. The former is situated on the left bank of River Tisa. The deep valleys, steep slopes, considerable altitudes, presence of rocky crests differentiate this massif from the other mountain group. The rocks are presented by crystal slates, gneisses and marble limestones.

In the area of the region various soil types are distributed: meadow and bog soils on alluvium, sod-podzolic soils on alluvium, as well as mountain meadow brown soils and sod brown soils. The characteristics of the first type of soils were given in the Ramsar sheet II. The sod-podzolic soils on the alluvium of low terraces are spread in the Pritisyanska Plain with the relief showing low hills, ridges and low lands. Shallow arrangement of ground waters provides gleization of the lower part of the profile. The humic alluvial horizon is not deep (does not exceed 20 cm), clearly grey, structureless and dispersed. The alluvial horizon is distinctly separated, strongly leached out, porous, 10 to 15 cm thick. Soil acidity is high, the pH of the soil extract is 3.9 to 4.8. The soils do not provide favourable conditions for plant growth due to their high acidity, structurelessness of the upper horizons and gleization of the lower ones. Brown mountain forest soils developed on the slopes within the forest belt from the foots of the mountains to 1100-1500 m a.s.l. Their mother rock is the aluvium-deluvium of the crystal rock flysch and magmatic deposits. Depending on the thickness and presence of rock debris there are deep (116 to 120 cm), middle-deep (60 to 75 cm) and shallow (40 to 50 cm) soils, as well as slightly and highly stony ones. The soils of this type are acidic (pH is about 4.0), not saturated by bases, considerably enriched by mobile aluminium, poor in mobile phosphorus and potassium. Mountain-meadow brown soils occur in the subalpine and alpine belts on the altitudes of 1100 to 1600 m. They were formed under the meadow and shrub vegetation. Their characteristic feature is the presence of peat turf or peat 10 to 12 cm thick. Under this there is the humic horizon (15 to 20 cm) with its markedly granular structure. The soils have a high actual acidity (pH 3.5-4.5), are well supplied with nitrogen, but are poor in phosphorus and potassium. The sod brown soils occur in all vertical belts of the mountain zone on forest-free plots used as natural fodder-producing areas. They developed as a result of the superimposition of the sod layer on the brown earths in the process of soil formation. They differ from the brown forest soils by the presence of darkish brown horizon of 20 to 30 cm thickness. There is a transitory greyish-brown horizon, 60 to 80 cm deep with nut-structure, which turns into the eluvium of bedrock (sandstone, slate, flysch). The soils have a medium supply of mobile forms of nitrogen and potassium, somewhat less of phosphorus, and a comparatively high acidity (pH 4.5- 5.0).

Hydrological values: River Tisa is the main water artery of Transcarpathia. It is formed by the confluence of rivers Chorna Tisa and Bila Tisa, four kilometres behind Rahiv.

River Chorna Tisa rises in the north-west slope of the Svydovets ridge on the altitude of 1400 m a.s.l. Its length is 49 km, the catchment area is 567 km². This is a typical mountain river with high banks and a deep, slightly sinuous valley. Its

channel width varies from 10 to 25-30 m. Its depth in the drought period being 0.2-0.5 m becomes 4 to 6 m in the period of floods. Cutting across the highest part of the Polonyna ridge, the river flows to south-west to River Bila Tisa.

River Bila Tisa rises in the south-west slope of the Chornohora on the altitude of 1650 m a.s.l. and flows in the latitudinal direction from east to west. Before the town of Velyky Bychkiv the river flows along a narrow valley with steep slopes and has a marked mountain character. In this section its tributaries (rivers Kosivska and Shopurka) from the right side, and River Visheu from the Romanian side drain into River Tisa. The average speed of the current is 2-4 m/sec. River Shopurka is formed by the confluence of Mala Shopurka and Serednya Rika, its length is 13 km (41 km together with Mala Shopurka), the catchment area is 283 km². It is a river of the mountain type with the stream gradient of 26 m/km. Its current speed in the drought periods is 2-3 m/sec.

Behind Velyky Bychkiv and up to Tyachiv the valley of River Tisa widens, and near the town of Bushtyno it reaches 3 to 5 km. The river here is of the piedmont character, its bed is 40-80 m wide. The lowest registered minimum water level in the observed section near Tyachiv was 54 cm, the highest maximum one was 694 cm, the amplitude of water levels is 748 cm. In this section its largest East-Transcarpathian right-side tributary, River Teresva, with a length of 56 km and a catchment area of 1220 km², flows into River Tisa. Before the village of Dilove River Teresva flows in a deep and narrow valley having a bottom width of 100-400 m. The width of the riverbed is 20 to 40 m, its depth is 0.5-1.0 m. Behind the village of Dubove the valley widens to 1-2 km. The riverbed is winding, branched with numerous isles, its width is 30-60 m, the depth of the river is 0.5-2 m.

The hydrological conditions of River Tisa is characterised by the abrupt changes of levels, instability of the flow and unstable ice formations on the river.

The most important determiner of the river flow is the characteristics of precipitation distribution. The highest amount of precipitation falls in the headwater area and can reach 1500 mm per annum, while in the piedmont areas this can reduce to 600-700 mm per annum. The daily amount of precipitation can reach 100 to 130mm and exceeds the average monthly standards. In the warm periods of year rains are responsible for flood runoff formation, and drastic thaws cause winter floods. It should be noted that winter floods sometimes have large scales.

The hydrochemical description of the waters of River Tisa is presented in Table 1 (Appendix).

The spring high water formation in the mountain section of River Tisa is essentially influenced by the conditions of runoff development in the prevernal period.

Taking into account the marked gradient of the riverbed in its mountain section (15.5 m/km near Rahiv, 12.7 m/km near Dilove), the level rise during the flood is very drastic, the abatement of high waters is slow, with numerous peaks caused by rainfalls.

The extreme values of water levels in River Tisa in the area of Rahiv-Tyachiv for the period of a series of years are given in Table 2 (Appendix).

The average water flow rate, according to observations made for River Tisa - Rahiv during a number of years, is 23.9 m³/sec, the average yearly specific discharge is 22.3 l/sec x km², for River Tisa - Dilove it is 34.1 m³/sec and 28.7 l/sec x km², respectively.

From Dilove to below Tyachiv River Tisa flows along the state border with Romania, so some hydrological observation data are incomplete or are not available.

Ecological features: The Region is characterized by an extremely high diversity of biotopes. Forest, meadow, waterside and anthropogenic biotopes prevail here, as well as ones of rocks, stone fields, bogs and ecotones. The zonalit of vegetation cover is pronounced, it is represented by the piedmont, mountain (upper, lower) and highland (subalpine, alpine) belts. In terms of phytogeography there are 6 floristic areas: the Khust-Solotvino (Maramarosh) depression, the inter-stream area between rivers Tereblya and Teresva, the Maramarosh Alps, the Chornohora, the Svydovets, the Horhans.

The principal plant types are represented by forest (Vaccinio-Piceetea, Querco-Fagetea, Quercetea robori-petraeae, Alneteca glutinosae, Salicetea purpureae), meadow (Molinio-Arrhenatheretea, Nardo-Callunetea, Festuco-Brometea, Salicetea herbaceae, Caricetea curvulae, Elyno-Seslerietea), shrub and undershrub (Betulo-Adenostyleta, Loiseleurio-Vaccinietea, Vaccinio-Juniperetea), waterside and wetland (Phragmito-Magnocaricetea, Montio-Cardaminetea, Scheuchzerio-Caricetea fuscae) and pioneer communities (Aspleminietea rupestris, Thlaspietea rotundifolii). Segetal communities - Plantaginetea, Galio-Urticetea - also have local distribution.

Noteworthy flora: The flora of the region is very rich and diverse. It reckons over 1000 vascular plant species. These include particularly endemic (94), rare taxa, as well as those included in the Red Data Book of Ukraine (118). A total of 366 vascular plant species of the region need protection.

For the annotated list of vascular plants and plant communities of the River Tisa basin, which include all of Transcarpathia, see the Appendix.

Noteworthy fauna: The fauna of the River Tisa headwaters and its valley is heterogeneous and varies with the hydrological and landscape-botanical features of the localities. Generally one can speak of two aspects of the fauna: the first is associated with the most mountainous part of River Tisa (from the rivers Chorna and Bila Tisa approximately as far as their confluence behind Rahiv.); the second is from Rahiv down the river as far as Tyachiv. Of course, this is only a conventional boundary between the two sections. Nevertheless, in the first section the following characteristic species prevail, see the Appendix.

Social and cultural values: The human population of the Upper Tisa have passed a complicated path of the historic development. The Hutsul ethnic group had formed here, which, along with the general Ukrainian and East Slavic features, has

some specific traits of culture and mode of life. The Hutsuls, unlike other Transcarpathian ethnic groups, have the grazing type of cattle breeding as their main occupation. Crop farming is of minor importance, and woodwork has been an auxiliary occupation there for a long time. The cultural-historic processes in the lives of the Upper Tisa people developed in close relationship with the Carpathian regional development at large. They reached the highest rise in the Hallstatt period - the decisive one in the Thracian culture (8th-7th centuries B.C.). The monuments of this culture are connected with salt- and iron-works. Later on, after the tribes from the Forest Steppe had penetrated into Transcarpathia and assimilated with the South Thracian tribes, the Kushtanovitsa culture formed there. The culture of the Celts, or La Tene culture, exerted its influence there around the 5th-2nd centuries B.C. After the decline of Celtic dominance, at the beginning of Anno Domini, the Getae-Thracian, or Getae-Dacian culture formed in the Carpathian region. This is one of the few cultures which had a true highland character. The late Roman period is famous for its original culture of Carpathian burial mounds, which was created by the Getae-Thracian tribes, and partly by the Slavs. This culture was likely to unite the Carpes - an old population of the region in the 2nd-4th centuries. The flourishing of the early Middle Age culture of the Slavs (Prague, Penkovo cultures) took place in the 6th-7th centuries. At the doorstep of the 10th century the culture of Luka-Raikovetska developed; at that time the Slavic tribes of the Carpathian Croatians formed their first unions: the principalities. There are numerous monuments of the above cultures displayed in the region.

In the Hutsul land economy cattle breeding, and first of all sheep breeding, was always the key branch. These domestic animals were of the greasing type (with seasonal herding) and were managed on the basis of collective ownership. Other kinds of farm animals like goats, cows, horses were also on grazing. The population have performed woodwork, logging and transportation of timber long since. Wood materials were used for construction, making tools and utensils, charcoal, pitch; they were used as fuel, etc. Important auxiliary occupations of the Hutsuls have been also apiculture, hunting, fishing, gathering mushrooms, berries and medicinal plants.

Land tenure/ownership:

Tyachiv district rada, Tyachiv district state administration

Bushtyno settlement rada, Tyachiv town rada, Bedevlyia village rada, Teresva settlement rada, Hrushovo village rada, Dibrova village rada, Solotvino settlement rada.

Rahiv district rada, Rahiv district state administration

Bila Tserkva village rada, Veliky Bychkiv settlement rada, Luzhanska village rada, Dilove village rada, Kostylivo village rada, Rahiv town rada, Bilinska village rada, Kvasy village rada, Yasinya settlement rada, Chorna Tysa village Rada, Roztoka village rada, Vidrychanska village rada, Bohdan village rada, Luhy village rada.

Current land use: The main territories are piedmont and mountain zones used for agricultural purposes (livestock, crop farming), for forestry and recreation. The Rahiv and Tyachiv districts have a state border with Romania. Their socio-economic specificity differs from that of other districts in the complicated conditions of living and in economic activity, particularly in agricultural work, because of the shortage of arable lands. A substantial part of the land is situated on slopes which make farming hard. The high density of the population living mainly in the River Tisa basin, sharpens the problems of employment. In both districts there are some useful minerals, the greatest attention is attached to the exploitation of marble and salt. As to the branches of industry, the most developed are forestry and wood-processing industry. In agriculture meat production, dairy live-stock farming and gardening are the principal fields. The population's supply with land in the Rahiv and Tyachiv districts is the poorest in the region: there is 0.1 ha and 0.3 ha of arable land per one resident of the district, respectively. Among the promising lines of land management there is the development of ecological (green) tourism and agricultural tourism. These lines are planned to be developed on the international level.

Factors (past, present or potential) adversely affecting the site's ecological character, including changes in land use and development projects:

Floods are frequent phenomena in the region. Some of them have caused considerable material damage to the objects of national economy and private possessions, they also were responsible for ecological catastrophes.

The floods affected most badly the Rahiv and Tyachiv districts in October 1992 and December 1993. During these floods the sewage disposal structures were damaged in Tyachiv, the Teresva wood works, Solotvino and Bushtyno. Highways of local and state importance were seriously damaged, too. Specially serious detriment was caused to the forest paths and forest engineering structures. The deficit of budget means less assistance for speedy recovery.

Conservation measures taken: In the Tyachiv and Rahiv districts over 80 valuable objects of "natural reserve stock" (NRS) as well as areas of different categories of reservation have been drawn under protection. In addition, in these districts over 90 mineral sources are registered. The largest among the natural reserve objects is the Carpathian Biosphere Reserve (CBR) occupying an area of 57.800 ha. As the territory of CBR was expanded in 1997, over 13 objects and areas of NRS were incorporated into it. Since these objects are numerous, in 1998 the State Department of Eco-safety carried through and co-ordinated the work on compiling their inventory.

Along the stream of River Tisa the following objects and areas of natural reserve stock are situated:

«Apshinetsky» - a hydrological reservation of state level; its area is 105 ha, Yasynya State Forest and Hunting Organization. The coniferous virgin forest and a dense network of water sources, giving rise to mountain streams which drain into River Chorna Tisa, are under protection.

«Radyansky Karpaty» - a forest reservation of local level. Its total area is 648.9 ha. It is a highly productive beech virgin forest with a considerable admixture of field maple, sycamore and other tree species. It is a gene pool for obtaining a stable forest tree seed base. It is of scientific and economic importance.

«Stanislav» - a botanical reservation of local level. Its area is 5.3 ha, Yasynya State Forest and Hunting Organization. Rare plants having been entered the Red Data Book of Ukraine are protected.

«Andromeda» - a botanical natural monument of local level. Its area is 6.0 ha, Chorna Tysa village, «Markovets» natural landmark. The sphagnum bog and a number of rare plant species are protected.

«Chorna Tysa» - an ichthyological reservation of local level. Its extent is 39.3 km², Yasynya State Forest and Hunting Organization, Svydovets and Stanislav foresteries. Rare valuable fish species are under protection.

Conservation measures proposed but not yet implemented: The present natural reserve stock of the River Tisa headwaters requires a certain degree of optimization. First of all, it is necessary to expand the territory of the Carpathian Biosphere Reserve (CBR) in the vertical gradient, to include subalpine and alpine vegetation types. It is worthwhile also to expand the present reserve massifs. A new reserve massif should be organized in the Svydovets, where now only a few small reservations are scattered in the area. As the last stage, it seems necessary to unite the CBR massifs, today isolated, into a single functional structure through the system of ecological corridors.

Current scientific research and facilities: The scientific research in the region concerns mainly biodiversity studies in the Carpathian Biosphere Reserve (CBR) and a series of other projects, which, to a certain extent, embrace the Upper Tisa Region. Among these there are the following which seem to be the most important:

1. Conservation of Carpathian biodiversity (Global Ecological Fund, 1994-1996). Performers: CBR; Institutes of Botany and Zoology, NAS, Ukraine; Institute of Carpathian Ecology, NAS, Ukraine; Universities of Lviv, Uzhgorod, Chernivtsi.
2. Red Data List of Transcarpathia: threatened plant species and communities (Systematic Association of Great Britain, 1995-1997). Performers: V. V. Kricsfalussy, G. B. Budnikov, A. V. Mihály.
3. Ramsar Wetland Area in the Upper Tisa Region (Ramsar Small Grants Fund, 1998). Performers: Ruthenia Carpathian Ecological Club.

Current conservation education: Ecological education has become especially active recently. Among the most important actions there are those carried on by the «Ruthenia» Carpathian EcoClub, the «Eco-Eks» non-governmental organization and the «Karpaty» EcoClub.

The «Ruthenia» Carpathian EcoClub (V. V. Kricsfalussy, A. Ye. Lugovoj, V. I. Sabadosh), together with the Regional Forest Department, organized a series of educational seminars for the workers of 4 foresteries (about 300 people) of this region, and published a manual titled «Forests of Transcarpathia» (1997). This

activity became possible through the help of the Carpathian Euroregion Development Fund. At the same time practical lessons were organized, as well as the mobile exhibition «Fauna of Transcarpathia and its conservation» (A. Ye. Lugovoj, L. A. Potish) which were sponsored by the ISAR Fund.

In addition, in the regional press (Kárpáti Igaz Szó, Novyny Zakarpattya, Yedinstvo-Plus, Rio-Inform) materials of eco-educational character are being published like, for example, the last series of articles under the general heading «Looking through the pages of the Red Data Book». Seven articles have already been published under that heading: «Beetles», «Butterflies», «Fish», «Amphibians», etc. (author: A. Ye. Lugovoj). Though the articles Transcarpathian nature conservation is addressed at large, at the same time they directly concern River Tisa and its valley.

The «Eco-Eks» NGO organizes All-Ukrainian ecological camps for schoolchildren in the CBR every year. Members of the EcoClub «Karpaty» take part in the work.

Current recreation and tourism: The Upper Tisa - Hutsul Land - is the most popular place for tourism in Transcarpathia, due to the diverse relief of the locality, wonderful mountain landscapes with picturesque lakes, slopes of different steepness and length for skiing, interesting walking and water routes, etc. There are a lot of tourist centres and shelters in Hutsul land. In Rahiv there is the «Tisza» tourist center (its shelter in the mountains is named «Perelisok»), in the village of Kobyletska Polyana one can find the «Tremita» tourist centre, in Yasinya there is «Edelveis» with two branches («Hoverla» and «Drahobrat»), and the «Moldova». The construction of two tourist hotels has been launched in Kvasy and Yasinya. The programme of recreation at these centres includes excursions by bus and on foot, skiing in the mountains, etc.

Jurisdiction:

Administrative structures of district level:

Rahiv district rada and Rahiv District State Administration
295800 Rahiv, 1 Miru Str.

Tyachiv district rada and Tyachiv District State Administration
295710 Tyachiv, 30 Nezalezhnosti Sq.

Administrative structures of regional level:

Regional Rada and Regional State Administration

294008 Uzhgorod, 4 Narodna Sq.

Regional Forest Department

294008 Uzhgorod, 4 Narodna Sq.

Regional Department of Agriculture and Food Products

294008 Uzhgorod, 2A Kotsubinsky Str.

State Department of Eco-safety in Transcarpathian Region

294008 Uzhgorod, 4 Narodna Sq.

Management authority: The objects and areas of the natural reserve stock belong to the following administrative structures:

- the Carpathian Biosphere Reserve is under the Ministry of Natural Environment and Nuclear Safety of Ukraine;
- the other objects - forest reservations and natural monuments - are under the protection of forest enterprises forming a part of the State Forest Committee;
- mineral sources outside the state forests are under the protection of agricultural enterprises and village radars.

Noteworthy fauna

Annotated list of animals

Fish: - *Salmo trutta* m. *fario* L., *Gobio uranoscopus carpatorossicus* Vladíkov, *Cottus poecilopus* Heckel.; amphibians: - *Triturus montandoni* Boul., *T. alpestris* Laur., *Bufo bufo* L.; reptiles: - *Lacerta vivipara* Jacquin; nesting birds - *Cinclus cinclus* L. and *Motacilla cinerea* Tunst.; mammals: - *Sorex alpinus* Schinz. At the same time, down the river, behind Rahiv, such species are more typical as *Thymalus thymalus* L., *Gobio albipinnatus* Fang., *Cobitis aurata* montana Vladíkov, *Cottus gobio* gobio Heck. The density of the above mentioned species decreased drastically, however, and *Triturus vulgaris* L., *T. cristatus* Laur., *Bufo viridis* Laur. appear. *Lacerta vivipara* Jacquin is replaced by *Lacerta agilis*. *Cinclus cinclus* L. does not nest along the central section of the stream any longer. Great numbers of the birds winter there, the density of *Motacilla cinerea* Tunst. declines conspicuously, while the number of *Motacilla alba* L. increases.

It should be noted that in the past there were artificial water basins in the very head of River Tisa, which were used for organizing timber rafting. These basins played an important role as spawning places for amphibians, including Red Data Book species, as well as sites for a series of hydrophilic birds - *Podiceps* spp., *Ardea cinerea* L., *Charadrius* spp., etc. Such basins should be reconstructed, since there are no natural lakes in the area of the Tisa headwaters.

In the forests which are near the polonyas (alpine meadows) there are species interesting for the European fauna such as *Elaphe longissima* Laur., *Aegolius funereus* L., *Glaucidium passerinum* L., *Ursus arctos* L., *Lynx lynx* L., *Cervus elaphus* montanus Bot. which have survived here.

Finally, the River Tisa valley is an important route for the seasonal migrations of birds, the Jablonets mountain pass with River Chorna Tisa being the most marked migration line.

The mammal fauna of the Upper Tisa is rather rich and diverse. Insectivorous mammals are represented by 9 species; very notable among them are *Sorex alpinus* Schinz and *Neomys*

anomalus Cabera, which have entered the Red Data Book of Ukraine. *Erinaceus europaeus* occurs only sporadically in the studied area.

The bat fauna, though it is a numerous group of mammals in the region, is not diverse in the River Tisa plain. Practically, only *Myotis daubentonii* Kuhl., *Plecotus austriacus* Fischer, *Nyctalus noctula* Schreb. and *Pipistrellus pipistrellus* Schreb. were found there. Other species very rarely fly to the river plain for hunting. All bats are very useful animals, they and their habitats should be protected.

Predators are represented by 13 species: *Martes martes* L. and *M. foina* Erxleb., *Mustela putorius* L., *M. lutreola* L., *M. nivalis* L., *M. erminea* L., *Meles meles* L., *Lutra lutra* L., *Ursus arctos* L., *Canis lupus* L., *Vulpes vulpes* L., *Felis sylvestris* Schreb., and *Lynx lynx* L. Among these the mink, the stoat, the badger, the otter, the European wild cat and the lynx have entered the Red Data Book of Ukraine. Small predators and *Lutra lutra* L. live in the river plain more or less permanently. For the others the river plain is only hunting place. Some species, like the wolf, rarely the bear and the lynx, may sometimes cause a conspicuous detriment to the hoofed livestock and domestic animals while the otter can reduce the amount of fish. The other species are mainly useful, since they consume a considerable amount of mice. Practically, all these species are valuable game, but, due to their small numbers, hunting for some of them is forbidden, for the others it is restricted.

Artiodactyles. There are 3 species - *Sus scrofa* L., *Capreolus capreolus* L., and *Cervus elaphus* L.. In the river plain they do not stay for long, they come here only for watering and resting. All the three species are game, their shooting is restricted. They are valued for their meat and hunting trophies.

Leporids are represented by *Lepus europaeus* Pall. It comes to the river plain to have a rest and take up fat.

The most numerous and representative group of mammals in the River Tisa plain are the rodents. There are about 15 rodent species, namely: *Sciurus vulgaris* L., *Glis glis* L. and *Muscardinus avellanarius* L., *Rattus norvegicus* Bark., *Mus musculus* L., *Apodemus agrarius* Pall., *A. sylvaticus* L., *A. flavicollis* Melch., *Clethrionomys glareolus* Schreb., *Arvicola shermani* Shaw., *Microtus arvalis* Pall., *M. subterraneus* De Selys Longchamps. *Glis glis*, *Microtus arvalis*, *Clethrionomys glareolus*, and *M. subterraneus* occur only in places where the forest is close to the riverbed. *Rattus norvegicus* and *Mus musculus*, however, can be seen near human settlements. The occurrence of the muskrat is not impossible in this area. Mice settle in the river plain reluctantly, since the frequent floods cause great damage to their populations.
